

Q1.

Photosynthesis is the process used by green plants and some other organisms to convert light energy into chemical energy.

(diagram below)

Q2.

The process mainly occurs in the chloroplast of the plant cell. It has two main stages:

1. Light reaction - Captures light energy.
2. Dark reaction - Uses energy to make glucose.

Q3.

Chloroplasts contain chlorophyll a and b.

Light reaction in thylakoid captures energy, Dark reaction in stroma makes glucose. Pigments capture light.

Q5.

Diagram of alveolus:

- Alveolar sac
 - Capillary network
 - Direction of gas exchange (arrow)
- (neat diagram drawn)
